NNRTI induced conformational changes in HIV-1 RT

The primary goal of this grant is to define the molecular mechanism(s) by which NNRTI inhibit HIV-1 reverse transcription. In addition, we propose to characterize a new class of RT inhibitor termed the template/primer competing RT inhibitor (TPcRTI). Because the TPcRTIs exhibit a novel mechanism of action, it is anticipated that, if developed, they will both complement and diversify existing HIV-1 therapeutic strategies, and more importantly, provide a new avenue for the treatment of multi-drug resistant HIV-1.

Development of single-molecule approaches to the study of helicases at the nanoscale level

The overall objectives of this research are to develop novel uses and novel configurations of single-pair fluorescence resonance energy transfer and magnetic tweezers. We will develop these single-molecule approaches and use them to study the PcrA helicase to answer important questions concerning its DNA binding, translocation and unwinding activities.

2. Community:

Each spring for three years (2009, 2010, 2011), my laboratory taught a class of fourth graders how to make speakers from Styrofoam plates as part of their understanding of electromagnetism. In 2011, volunteers from my lab taught genetics to a class of six graders, and in 2013, I organized a tour of the Hillman Cancer Center by 30 sixth graders with the participation of Professors Yuan Chang, Yang Liu, and Vesna Rapic-Otrin.

I assisted with Active Motif’s donating \$1000 to the Pittsburgh Science 2009 research symposium.
